# Portfolio Lab — video marketing kit

*Scripts, prompts, tools and a production checklist · build 1.45*

## The one-line positioning

“ChatGPT can write the memo. It cannot keep the ledger.”

The product is a dated, immutable portfolio record: snapshots, a chained time-weighted return, a student-written journal and a report a professor can audit. The proof is the screen, not a claim.

## Who it is for, and where they are

- Finance and investment-club students: TikTok, Reels, Shorts, Discord, campus clubs.
- Instructors and entrepreneurship centres: LinkedIn, department newsletters, conferences.
- Mock-fund competitions and cohort programmes: partnerships and free pilot licences.
- Search intent: “portfolio report template”, “time-weighted return calculator”, “mock fund journal”.

## Five hooks you can reuse

- “Your professor asked for a portfolio report. You have three stocks and no idea what your return is.”
- “Adding your weekly returns is not a time-weighted return. Here is the difference in 30 seconds.”
- “A chatbot writes the memo. It cannot show a dated snapshot, a contribution kept out of performance, or a return that chains week by week.”
- “From three holdings to a graded report in 12 minutes.”
- “The line your professor will ask: where did this price come from? Show the provenance table.”

## 30-second TikTok / Reels script

- 0-3s: HOOK. “Your professor asked for a portfolio report. You have three stocks and no idea what your return is.”
- 3-8s: PROBLEM. “Most students add their weekly returns. That is not a time-weighted return, and a contribution is not performance.”
- 8-22s: DEMO. Screen-record: create a mock fund → add AAPL, MSFT, VOO → enter prices → snapshot → show “All 12 checks passed” → open the Word report.
- 22-27s: PROOF. “Dated snapshots. A chained return. A journal in your own words. A report you can defend.”
- 27-30s: CTA. “Free sample report and explainer in the link. Build your first fund this week.”
- Style: vertical 9:16, navy/teal, large captions, real UI only, no fake testimonials.

## 60-second YouTube Shorts demo

- 0-5s: “This is a portfolio report a professor can actually grade.”
- 5-15s: Show the landing hero. “Start a paper portfolio or a semester mock fund.”
- 15-30s: Create a fund, add three holdings, give one reason for each.

- 30-42s: Enter prices, create the snapshot. Point at NAV, invested, cash and top three.
- 42-52s: Open the journal, add a flow and a benchmark, show the time-weighted return.
- 52-60s: Export the Word report; show “All 12 checks passed”. CTA: free sample and explainer.

## AI video generator prompt (InVideo / Runway / Pika)

Create a 30-second vertical fintech product demo, 9:16, clean and premium, navy #071A2B to teal #0B5A4A gradient, white sans-serif captions.

Scene 1 (0-4s): a laptop on a desk, screen glowing, slow push-in. Text: “Your portfolio report, without the spreadsheet panic.”

Scene 2 (4-12s): screen capture of a dark portfolio dashboard; big NAV number, three small stat tiles; cursor clicks “Create the snapshot”.

Scene 3 (12-20s): close-up of a holdings table and a green “All 12 checks passed” panel; subtle checkmark animation.

Scene 4 (20-26s): a Word report page opens; highlight “Holdings and rationale” and “Journal of decisions”.

Scene 5 (26-30s): logo + text “Portfolio Lab — build a book you can defend.” CTA “Free sample report.”

Rules: no fake people, no fake testimonials, no invented numbers; use only the numbers visible on screen. Smooth cuts, soft whoosh, light keyboard clicks.

## 30-second voiceover

Your professor asked for a portfolio report. Not a screenshot. A record. Declare your holdings, enter one dated price per position, and take a snapshot. The engine computes NAV, weights and concentration, and runs twelve checks. For a mock fund, add a weekly journal, a contribution and a benchmark, and it chains a time-weighted return. Then export the Word report: objective, holdings and rationale, performance, decisions, provenance and limits. Portfolio Lab. Build a book you can defend.

## LinkedIn / X post

Most student portfolio reports fail on one thing: there is no ledger.

A chatbot can write a memo. It cannot show a dated snapshot, a contribution kept out of performance, or a return that chains week by week.

Portfolio Lab does: paper portfolio or semester mock fund; manual, pasted or CSV prices (optional quote fetch); NAV, weights, concentration; time-weighted return plus benchmark; a journal in the student's own words; a Word report with plain-language checks and named limits.

## Free tools to test

| Tool | Best for | Free tier |
|---|---|---|
| CapCut (capcut.com) | TikTok/Reels editing, captions, templates | Free, watermark-free |
| Canva (canva.com) | Thumbnails, social templates, simple video | Free plan |

| | | |
|---|---|---|
| Clipchamp (clipchamp.com) | Screen + webcam, text-to-speech | Free |
| Adobe Express (express.adobe.com) | Social cuts, branded templates | Free tier |
| InVideo AI (invideo.io) | Prompt-to-video | Free plan, watermark |
| Fliki (fliki.ai) | Script-to-video with AI voice | Free plan |
| HeyGen (heygen.com) | AI avatar presenter | Free trial/credits |
| Runway / Pika / Luma | B-roll and motion shots | Free credits |
| OBS Studio (obsproject.com) | Real screen recording | Free |
| Loom (loom.com) | Quick narrated demo | Free tier |

## Recommended stack

- Record the real workbench with OBS or Loom; the screen is the proof.
- Cut in CapCut for pace and automatic captions.
- Use Canva for the thumbnail and the end card.
- Use an AI avatar or generated b-roll only as garnish; never as the product demonstration.
- Keep one 60-second master recording and cut the 15s, 30s and vertical versions from it.

## Production checklist

- Format: 1080 × 1920 for Reels/Shorts/TikTok; 1920 × 1080 for LinkedIn/YouTube.
- First frame: the hook in 6 words or fewer.
- Captions on, because most feed viewing is silent.
- Blur or avoid any real student name, email or key.
- Show a real number and the checks panel; do not invent a return.
- End card: product name, one-line promise, link.
- Export MP4 (H.264), then upload natively to each platform.

## Launch sequence

- Week 1: post the 30s hook and the 60s demo; pin the sample report.
- Week 2: publish the “why your TWR is wrong” education video.
- Week 3: offer 20 instructors a free cohort pilot; ask for one testimonial.
- Week 4: publish the case study and a student walkthrough.
- Always: one call to action, one link, one measurable next step.

## What to measure

- Views are vanity; watch for saves, shares and profile visits.
- Sign-ups, first snapshot created, first report exported.
- Instructor pilots and weekly fund retention.
- Which hook produces the most saves; double down on that one.

## Rules

- No fake testimonials, no invented student names, no invented returns.
- Use the real sample report and say the prices are simulated.
- Do not claim the app predicts prices, picks stocks or executes trades.
- Do not show a key, a real portfolio or a private document on screen.
