Introduction

This draft responds to: A mid-sized grocery chain is considering acquiring a cold-chain logistics provider in Saudi Arabia. Complete a Five Forces analysis for the board.. It uses Porter's Five Forces to organise the industry evidence. Sourced items are cited; case assumptions are labelled; a force with no source is a named gap. The draft does not assign ratings or recommend a decision.

Five Forces

Industry rivalry

Case assumption: The acquisition would face rivalry from existing grocery chains and cold-chain logistics providers that could respond with price and service competition, constraining the combined business's pricing power.

Threat of new entrants

Saudi Arabia owns the 29th largest E-commerce market in the world, however, grocery is considered the smallest Saudi E-commerce market based on its revenue. This study aims to investigate the effects of various factors on consumers' intention to use E-grocery shopping in Saudi Arabia. (Alsulaimani, 2024)

Threat of substitutes

Case assumption: Grocery customers could turn to alternative cold-chain solutions such as other logistics providers or in-house arrangements, limiting the acquired provider's ability to raise prices.

Buyer power

Following the rapid spread of coronavirus "COVID-19" around the world and the imposed confinement measures by governments, the food retailing sector has experienced

tremendous shifts in trends among consumers. Due to uncertainty of the future, the food sector faced an imbalance in supply demand, following the shift towards online grocery shopping to mitigate the risk of infection from supermarkets. (Osailan & Al-Kubaisy, 2022)

Supplier power

Digitalization of the supply chain has become imperative for the Saudi Arabian industry as it relates to the government's Vision 2030 which ties industrial diversification, localization, competitiveness in logistics services, technological capability and exports other than oil to each other. The current research paper will investigate ways of leveraging digital supply chain tools in enhancing manufacturing productivity within the Kingdom of Saudi Arabia based on visibility, integrated planning, supplier coordination, automation, and resilience. (Miskini, 2026)

Discussion

What the evidence shows

The five forces returned 5 item(s): 3 sourced item(s), 2 case assumption(s) and 0 named gap(s). The sourced items carry a citation; the assumptions are starting points for the student's own case, not evidence.

Limitations

The draft does not rate the forces, compute an overall attractiveness score or recommend a decision. A case assumption is not a source, and a gap is not a finding. The student must verify every assumption and add the judgment before submission.
